EquitiesV1   [⬇ Download]   ★★★★★

This indicator is for equities traders, to compare current performance with the 'other 3' equities and an average of all 4.
It adds data series for ES, NQ, RTY and YM, shows % change for each since the session open (24 hr session, not just the day session) as well as a simple moving average of all 4. The SMA period is user-configurable. Default is 10.

Please note that the expiry date is one of the parameters. It's hard-coded with an 09-18 expiration, but you'll need to manually update that when you use the next contract date. (Or an earlier one)

I know I could have made the code extract the current expiry date, but the truth is I didn't feel like bothering working out that code again. (Did it for a previous indicator in NT7.)

I hope some of you find this indicator of use.

7ZIP [Market Replay CL 09-18 (NT8)](#) [⬇ Download]

NT 8 Market Replay data for CL

Contract: CL 09-18

Download instructions:

dowload and unzip file in NT 8 replay folder
Documents\NinjaTrader 8\db\replay
The file will create a folder with the relevant front month and
a series of .nrd files inside (one per day)

Make sure to use the "extract here" function as shown, and not the "Extract to" function, to avoid the creation of a
folder within a folder.

[👍 Thanks]

Note: this is Market Replay data for NinjaTrader 8. The format is different from NT7.

🖥 [Double Smoothed Stochastics (amaDSSBressert)](#) [⬇ Download] ★★★★★

Version 1.0 August 14, 2018

The **Double Smoothed Stochastics** by **Walter Bressert** came
after William Blau presented his version of the Double Smoothed
Stochastics in 1991. Both indicators are widespread in the trading
community, but they use different algorithms. While William Blau
applied separate smoothing to numerator and denominator, Walter
Bressert simply applied the Stochastics %K line to itself. Applying the
Stochastics twice leads to an acceleration of the running pattern.
Furthermore the Double Stochastics is smoother when compared to
the classic Stochastics and generates signals more frequently.

The Double Stochastics by Walter Bressert ships with NinjaTrader as
in-built indicator. This version of the Stochastics adresses a few
issues of the NinjaTrader default indicator:

- The default indicator has preset the %K line smoothing to 3, value

which cannot be changed.
- The default indicator does not have a signal line.
- The default indicator can only be applied to price, but cannot be applied to other indicators.

This version allows for setting the smoothing period for the %K line, comes with a signal line and maybe applied to other indicators as input series.

Better Volume (amaBetterVolume)   ⬇ Download ☆☆☆☆☆

Version 1.1 September 12, 2018

This indicator is based on the original version of the **Better Volume** Indicator from www.emini-watch.com. It identifies the following events relative to the selected lookback period:

Breakout or climax bars: A breakout or climax bar is a wide range high volume bar for which the the product "volume times range" is higher than for all preceeding bars of the lookback period.

Churn bars: A churn bar is a narrow range high volume bar for which the ratio "volume per range" is higher than for all preceeding bars of the lookback period.

Climax churn bars: A climax churn bar is a high volume bar that qualifies both as a climax bar and as a churn bar.

Low volume bars: A low volume bar is a bar which has a lower volume than for all preceeding bars of the lookback period.

The indicator uses two lookback periods. The larger lookback period identifies stronger climax and churn bars, the smaller lookback period points to weaker climax and churn bars and is used to identify low volume bars.

A breakout or climax bar may occur at different locations. It may start a trend as a breakout bar, it may indicate that an existing trend continues after price has consolidated or it may occur at the end of a trend and indicate that the trend is near exhaustion. This bar type is similar to classic types of gaps that may be found on daily charts. There are runaway gaps, continuation gaps and exhaustion gaps. Breakout or climax bars may be used as a subsitute for those gaps when trading smaller timeframes.

Relative Volume: When you use the BetterVolume indicator with intraday data, it is pretty much distorted at the beginning of the regular session. When compared to pre-session bars, all the bars in the beginning of the regular session look like high volume bars, which in turn leads to false signals. This behavior is corrected when the Better Volume indicator is applied to "relative volume" instead of "absolute volume". This version of the indicator allows for performing the Better Volume calculations on both absolute volume and relative volume.

Sound Alerts: The indicator comes with sound alerts.

Market Analyzer Column: I have included a market analyzer column with the install file. The market analyzer column will return bar codes for each type of signal: strong climax churn bar = 0, strong climax bar = 1, strong churn bar = 2, weak climax churn bar = 3, weak climax bar = 4, weak churn bar = 5, low volume bar = 6, upclose no signal bar = 7, downclose no signal bar = 8, doji no signal bar = 9. Based on these values you may define cell conditions and show the signals as text with background color on the market analyzer.

Update version 1.1: Bug removed. Sound alerts did not fire, because the path for the sound files had not been initialized.

Nota: The forum software has renamed the downloadable zip file to the false version number 1.0. Please disregard the version number of the zip file. The zip file contains the indicator version as specified above.

PriceLineV1   ⬇ Download ☆☆☆☆☆

This indicator merely draws a horizontal line at the current price, updating as price changes.

I find it kinda handy for noting when price is approaching previous turning points without drawing S/R lines all over the place.

NOTE:
Version 8.0.15.1 of Ninjatrader includes an indicator they cleverly called PriceLine. It will break this indicator, but provides the same functionality as this plus can show a Bid and an Ask line. rendering this indicator obsolete.

BarsInARowV1   **⬇ Download**   ⭐⭐⭐⭐⭐

As requested, this indicator has been updated for NT8.

It merely counts the number of rising and falling bars that occur in succession, resetting the number every time a bar either goes the other way or closes at the same value as it opens.

This also includes an SMA of both rising and falling bars with a user-configurable SMA period.

Hope you find some use for it.

Multiple Selections for Candlestick Patterns NT8   ⬇ **Download**   ⭐⭐⭐⭐⭐

Version 1.0
Exported from NT 8.0.14.1 64 Bit

This is a modification to the existing candlestick pattern indicator
included with NT 8. Their version only allows for selecting one pattern
at a time. This version allows you to select all or each one
individually. Otherwise it operates the same as the old version.

To allow each type to be selected, uncheck the box that says
"Find_All" then check the boxes you want the indicator to find.

If you leave the check box "Find_All" checked it will find all
regardless of how you have the others set.

I have a decent computer and I notice a little lag when "Find_All" is
selected. Use with caution.

Bar Timer Located At The Bar   ⬇ **Download**   ⭐⭐⭐⭐⭐

Version 1.0
Exported from NinjaTrader 8.0.14.1

Modified the existing bar timer to move the time remaining next to the current bar.

If the time left is less than 1 hour it will only display minutes and seconds otherwise it will display hours, minutes and seconds remaining.
